

Modeling of a Vertical Cavity Surface Emitting Laser (VCSEL) Diode in VirtualLab Fusion

Abstract

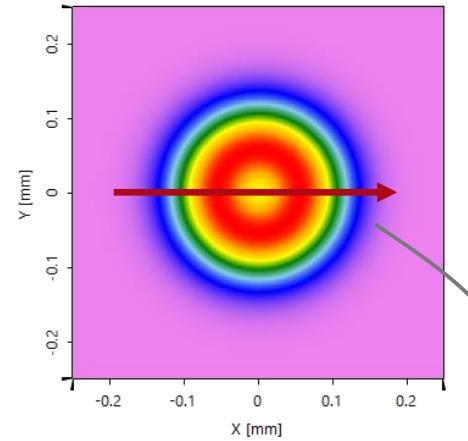

Vertical cavity surface emitting laser (VCSEL) diodes are of interest for numerous applications, such as optical sensors and pattern generators. In order to be able to investigate these kind of setups in VirtualLab an appropriate source model is required. In this document it is shown, how a VCSEL source can be configured in VirtualLab Fusion.

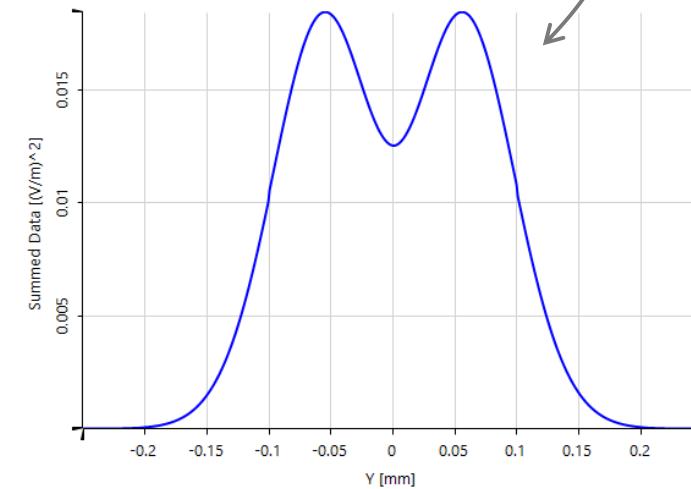

Modeling Task

VCSEL diode
central wavelength: 940 nm
half-angle divergence: 11°

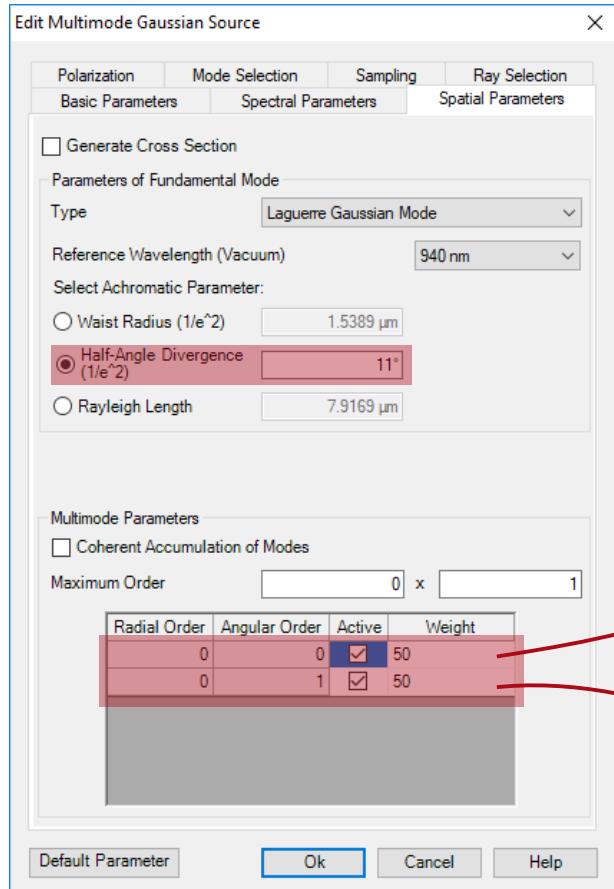

2D intensity

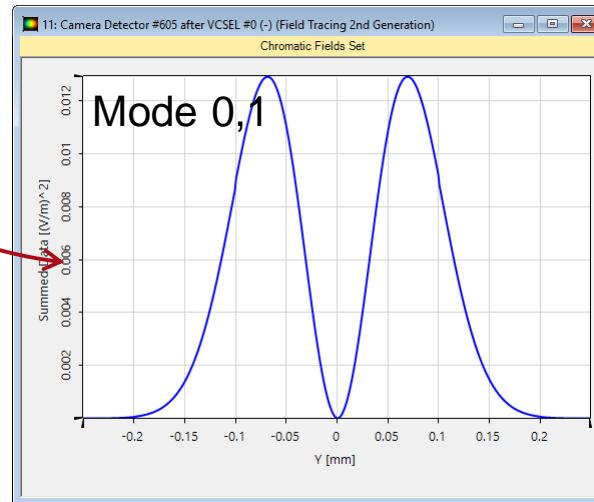

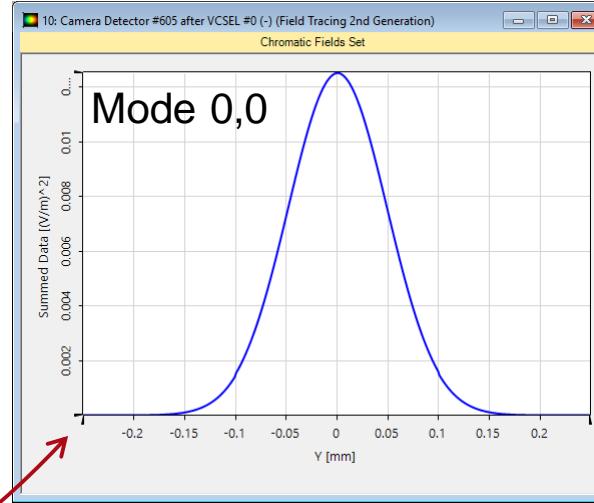

1D intensity profile

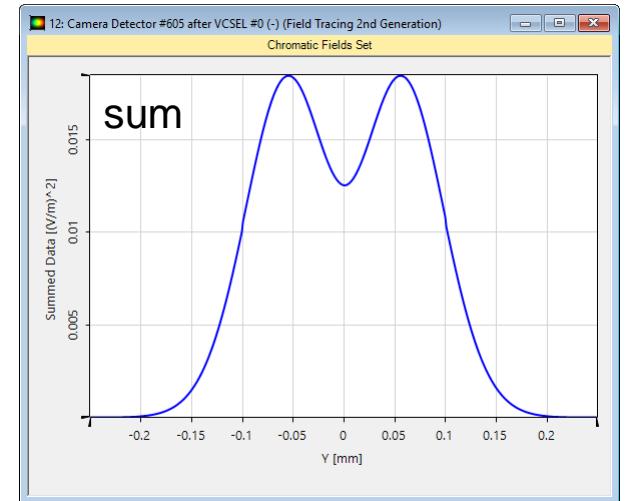

Mode Decomposition for VCSEL Modeling

Multimode Gaussian Source
is used to model the VCSEL

Two Laguerre Gaussian modes are combined in order to model the characteristic beam profile of a VCSEL

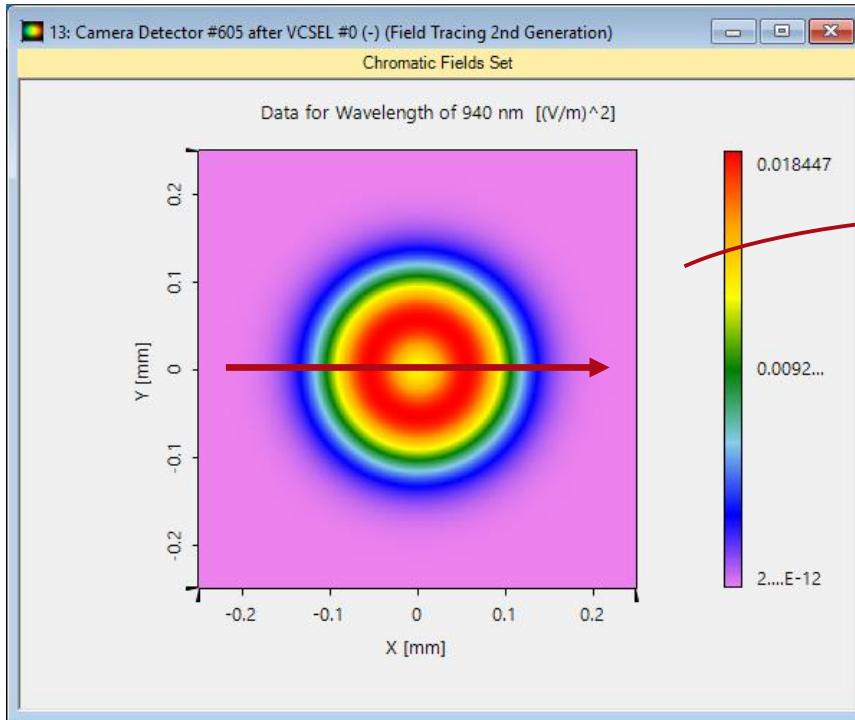

By adjusting the weights of the modes and e.g. divergence, almost every profile can be modeled.

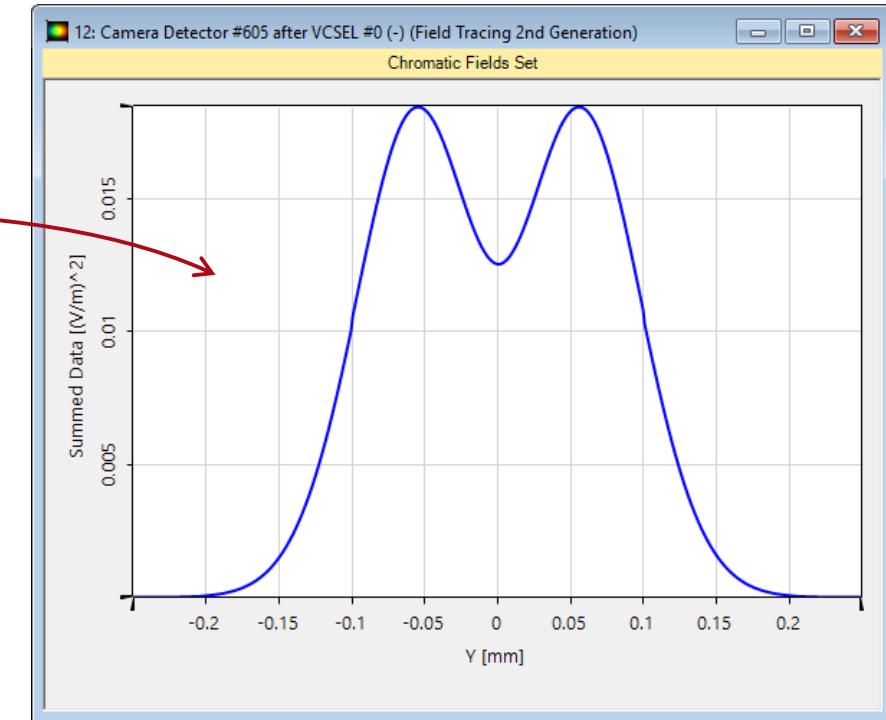

Results

beam profile of the modeled VCSEL

2D intensity

1D intensity

Workflow in VirtualLab

- Set up input Gaussian field
 - [Basic Source Models](#)

Document Information

title	Modeling of a Vertical Cavity Surface Emitting Laser (VCSEL) Diode in VirtualLab Fusion
document code	tba
version	0.9
toolbox(es)	Starter Toolbox
VL version used for simulations	7.4.0.49
category	Application Use Case
further reading	-
